

NAJMI - SOFTWARE ENGINEER

2014496.najmi@gmail.com | linkedin.com/in/najmi207 | naohr.site

Software Engineer specializing in backend development and system integration, experienced in building scalable middleware and payment solutions. Skilled in developing high-performance APIs, event-driven systems, and financial transaction services. Passionate about solving complex problems, optimizing systems, and delivering reliable solutions aligned with business needs.

Professional Experience

Internal E-Wallet Product | Indivara - North Jakarta — Dec 2025 - Present

Technical Consultant & Team Lead

- Led the convergence of two separate wallet codebases serving the Philippines and Indonesia into a single runtime-configurable platform, driven by a YAML-based country configuration in the core service that determines which market-specific behaviours apply per deployment
- Designed the platform's core balance model supporting three configurable modes — standard, shared (one principal issuing multiple wallet applications with unified balances and transaction records), and closed loop — serving as the single key driving all transaction and reporting flows
- Designed country-pluggable integration layers so a single codebase could switch QR standards (QRIS for Indonesia, QRPH for the Philippines), route to different payment gateways, apply market-specific KYC and transaction flows, and optionally enable third-party anti-fraud screening through configuration
- Led a 6-person team (4 backend, 1 frontend, 1 mobile) through SIT and UAT across two country environments while contributing directly to backend development, running daily progress checkpoints and delivering phase 1 to production go-live
- Gathered requirements directly from the product team and surfaced business scenarios missing from the FSD before development, translating agreed behaviour into technical specification documents (TSD)
- Designed a balance correction capability from the ground up, replacing a manual correction process with a system-driven flow requested by the product team, and led the team through implementation
- Cut development time of phase 2 by ~35% against the original estimate by integrating AI-assisted coding into the team's delivery workflow
- Implemented account and card binding for the wallet, integrating internal payment services with external switching partners

Middleware Integration System | Indivara - North Jakarta — Apr 2025 - Present

Team Lead

- Promoted from developer to Tech Lead mid-project to take over delivery of a platform migration program at an export-import financial institution — replacing MuleSoft with IBM webMethods and migrating the legacy Middleware Payment System to a new React/Spring Boot stack.
- Led a cross-functional team of up to 8 through development, SIT, UAT, and production go-live, tracking progress via daily checkpoints in Jira and personally owning technical and business issue resolution through UAT to launch
- Proposed and drove a design change that eliminated a redundant webMethods installation on the government partner's infrastructure, tunneling external applications directly into the bank's webMethods DMZ — cutting RHEL and webMethods license costs, removing one network hop from the transaction path, and consolidating logs within the bank's managed environment
- Drove multi-party requirement gathering with the client and 10+ of its third-party vendors, reconciling conflicting system requirements into unified middleware integration designs and authoring the technical specification documents (TSD)
- Designed and implemented a dedicated pre-processing service in IBM webMethods to split multi-message SWIFT MT/MX files into individual messages, absorbing a requirement change during late-stage UAT without modifying the already-validated core processing service
- Designed a message bridge in IBM webMethods to resolve format conflicts between SWIFT and RTGS transaction flows, enabling both rails to reuse a single shared service instead of duplicate implementations, and delivered multiple rounds of Virtual Account business rule changes without service disruption
- Delivered a new SWIFT-to-ACUMEN file transfer requirement by extending an existing service to handle SWIFT MT message formats, avoiding the cost of building and maintaining a separate service
- Owned end-to-end deployment of MPS (Middleware Payment System) across SIT, UAT, and Production — configuring NGINX for the React frontend, authoring systemd unit files for Spring Boot backend services, and installing and configuring Kafka and Redis
- repared RHEL servers across SIT, UAT, and Production — covering subscription management, system updates, and pre-installation tooling — and validated secure bidirectional communication paths between external parties, the DMZ, and internal services
- Designed and implemented automated ingestion pipelines in IBM webMethods using scheduler-driven file polling, moving CSV extracts from 5+ surrounding applications' SFTP endpoints into the enterprise data warehouse
- Designed a post-production service to ingest SWIFT MT910 confirmations — processing files through IBM webMethods into MPS, enriching parsed data from the Core Banking System, and enabling operations users to review and correct records before posting, reposting, or returning misrouted messages — and led a 4-person team through implementation

- Provided BAU and production support post go-live, guiding a 3-person maintenance team through incident handling and Root Cause Analysis until the platform stabilized to single-person support coverage
- Gathered requirements and designed solutions for post-production change requests spanning configuration-level changes to entirely new services, guiding the CR team through implementation

API Gateway Project | Indivara - **North Jakarta** Jan 2025 - Apr 2025

Technical Consultant

- Independently built an ISO 8583 ↔ SNAP message converter against the bank's core system specification, delivering 8 services — internal and external inquiry, balance inquiry, intrabank and interbank transfers across BI-FAST and Online Transfer rails, settlement, echo, and status check — translating inbound SNAP requests to ISO 8583 and mapping responses back
- Built the asynchronous callback pipeline receiving ISO 8583 callbacks from the core system and forwarding results to client callback URIs, with a scheduler-driven status check that reconciles transactions when no callback arrives within one minute
- Implemented ISO 8583 communication over a multiplexed TCP/IP connection, correlating concurrent request-response pairs by composite transaction key over a single persistent socket instead of opening a connection per transaction
- Migrated database version control from Flyway to Liquibase across multiple services and 20+ changelogs, converting existing scripts into a database-agnostic XML format to support multiple database engines and simplify review
- Set up Dev, SIT, and UAT environments on RHEL end-to-end — installing and configuring Oracle Database, Kafka in KRaft mode, Redis, and NGINX, building deployment services for Spring Boot backends and the React dashboard, and working with DBA teams on schema design

Internal Middleware Payment Rail | Indivara - **North Jakarta** Mar 2024 - Dec 2024

Technical Consultant

- Developed Internal Inquiry, External Inquiry, Interbank Transfer Transaction History, and QRIS CPM services in compliance with BI-SNAP specifications.
- Enhanced Spring Boot OAuth2 authentication to support BI-SNAP authentication standards.
- Integrated middleware services with Mandiri API as part of SNAP-BI specification implementation.
- Designed and implemented callback APIs from middleware to client systems aligned with BI-SNAP specifications.
- Co-designed and developed the AVM dashboard, focusing on task list management functionality.
- Built an ISO 8583 message converter to support interoperability with SNAP specifications and vice versa.
- Conducted stress testing in the middleware environment using Locust, including scenario scripting for transaction simulations.
- Performed Kubernetes scaling operations in conjunction with stress testing to evaluate system performance and resilience.
- Provided bug fixing and production support for issues related to payment processing and dashboard features.

SME Suites | Indivara - **North Jakarta** Nov 2024

Technical Consultant

- Developed integration APIs to support connectivity with various SME platforms, including merchant applications and payroll/payment systems.
- Implemented the initial Kafka-based Request–Reply communication pattern across multiple internal systems.
- Performed bug fixing and code refactoring to improve system reliability, maintainability, and performance.

Internal E-Wallet Product | Indivara - **North Jakarta** Dec 2024 - Mar 2025

Technical Consultant

- Helped automate Flutter application customization for Android and iOS builds using Ansible
- Designed and enhanced the Register API for internal E-Wallet member onboarding.
- Developed multiple transaction worker services to transfer transaction data to wallet systems using Kafka.
- Built an inbound–outbound rule management system for principal and CO accounts (create, update, delete) via Kafka messaging.
- Designed database schema (DDL scripts) and implemented Flyway database migrations for transaction and CO-related processes.
- Developed a general-purpose Balance Deduction System to support direct-deduct transaction mechanisms.
- Built a Middleware Payment API to facilitate communication between transaction services and Message Bus Biller APIs.
- Developed a QRIS Translation API in compliance with Rintis QRIS specifications.
- Implemented a Bank Pool Summary Consumer System to monitor CO escrow balance movements.
- Designed and optimized reporting systems using SQL and JasperReports, supporting multi-format exports (Excel, CSV, PDF)
- Provided debugging and issue resolution support during the development phase to ensure application stability.

E-Wallet for Bank of Philliphines | Indivara - **North Jakarta** Jul 2023 - Dec 2024

Technical Consultant

- Implemented a Balance Deduction System using Apache Kafka Consumer as part of the Send Money Between Member and Request Money Between Member transaction features.
- Developed and integrated the Peer-to-Peer Outgoing Transaction Inquiry Process, ensuring smooth and reliable transaction validation
- Built and integrated the Account Upgrade Feature, connecting Bank Online Accounts to the e-wallet ecosystem.
- Constructed and optimized Reporting Systems using SQL and JasperReports, with multi-format export capabilities (Excel, CSV, PDF).
- Engineered and integrated a Cardless Withdrawal Transaction Feature, enabling seamless main process operations.

- Resolved various development-related issues, improving system stability and performance.

Education Level

Telkom Online Learning University - **Bandung** Sep 2025 - Sep 2029 (Expected)

Bachelor of Information Technology

Competencies & Knowledges

- **Hard Skills** : Java (Backend Programming), JavaScript, Python, Spring Boot, Express JS, React JS, Next JS, Oracle Database, PostgreSQL, MongoDB, Apache Kafka, Redis, Systemd Deployment, Jasper Report, Unit Testing, Integration Testing, Nginx, WebMethods, Docker, RHEL, ISO 8583, Swift MT MX, RTGS MT, BI-SNAP
- **Soft Skills**: Critical Thinking, Team Work, Communication, Leadership, adaptability, Solution Oriented, Conflict Resolution,
